

ABSTRACT

A coating film 9 is formed on a light guide-mounting portion of a frame 2.

5 This coating film 9 presents a color reflecting light over a wide range of wavelength such as a white color. Instead of forming the coating film 9, a light guide 3 can also be mounted through a thin paper-shaped member such as a white-colored paper or a silver-colored paper that allows light to reflect. The coating film or the thin paper-shaped member can be provided not only on the bottom surface of the light
10 guide-mounting portion of the frame 2, but also on the side thereof.
